Testing Express APIs with Jest Project Requirements

Minimum requirements

More than two items marked incomplete in this section will result in the project receiving a failing grade.

	Complete?
The project must be committed to a version control system with clear commit messages reflecting progress.	
The project must follow a modular structure with separate folders for routers and controllers.	
The project must include unit tests for all API endpoints using Jest and Supertest.	
Tests should cover common success cases as well as error cases.	
The following RESTful API routes must be implemented and functional:	
GET /resources – Retrieve all resources.	
GET /resources/:id – Retrieve an resource by ID.	
POST /resources – Create a new resource.	

Code convention and UI/UX requirements

More than two items marked incomplete in this section will result in the project receiving a failing grade.

	Complete?
The code must be well-organized and modular, with functions handling specific tasks.	
The code should follow Javascript best practices and be well-documented with comments where necessary.	
Error messages should be clear and informative, guiding users to correct their input.	

README requirements

More than two items marked incomplete in this section will result in the project receiving a failing grade.

	Complete?
The app's name.	
A brief description of your app and its functionality.	
A ***Getting started*** section. This section should include instructions on how to interact with your app.	
A ***Technologies used*** section. This section should list the principal technologies used by your application, for example, Javascript and any major frameworks or libraries.	
If necessary, an ***Attributions*** section. This section should include links to any external resources (such as libraries or assets) you used to develop your application that require attribution. You can exclude this section if it does not apply to your application.	

Summary

Project meets minimum requirements and passes.
